3-D Clouds

- Solar radiation is the sole large-scale source of diabatic heating that drives the weather & climate system on planet Earth.
- Terrestrial radiation keeps the planet in balance to make Earth habitable for all forms of life.

- Aerosols may play an important role in modifying solar and terrestrial radiation.
- Understanding that role is critical to understanding the energy balance that shapes our weather/climate.

Understanding the role of aerosols means

Understanding how the properties of those aerosols...

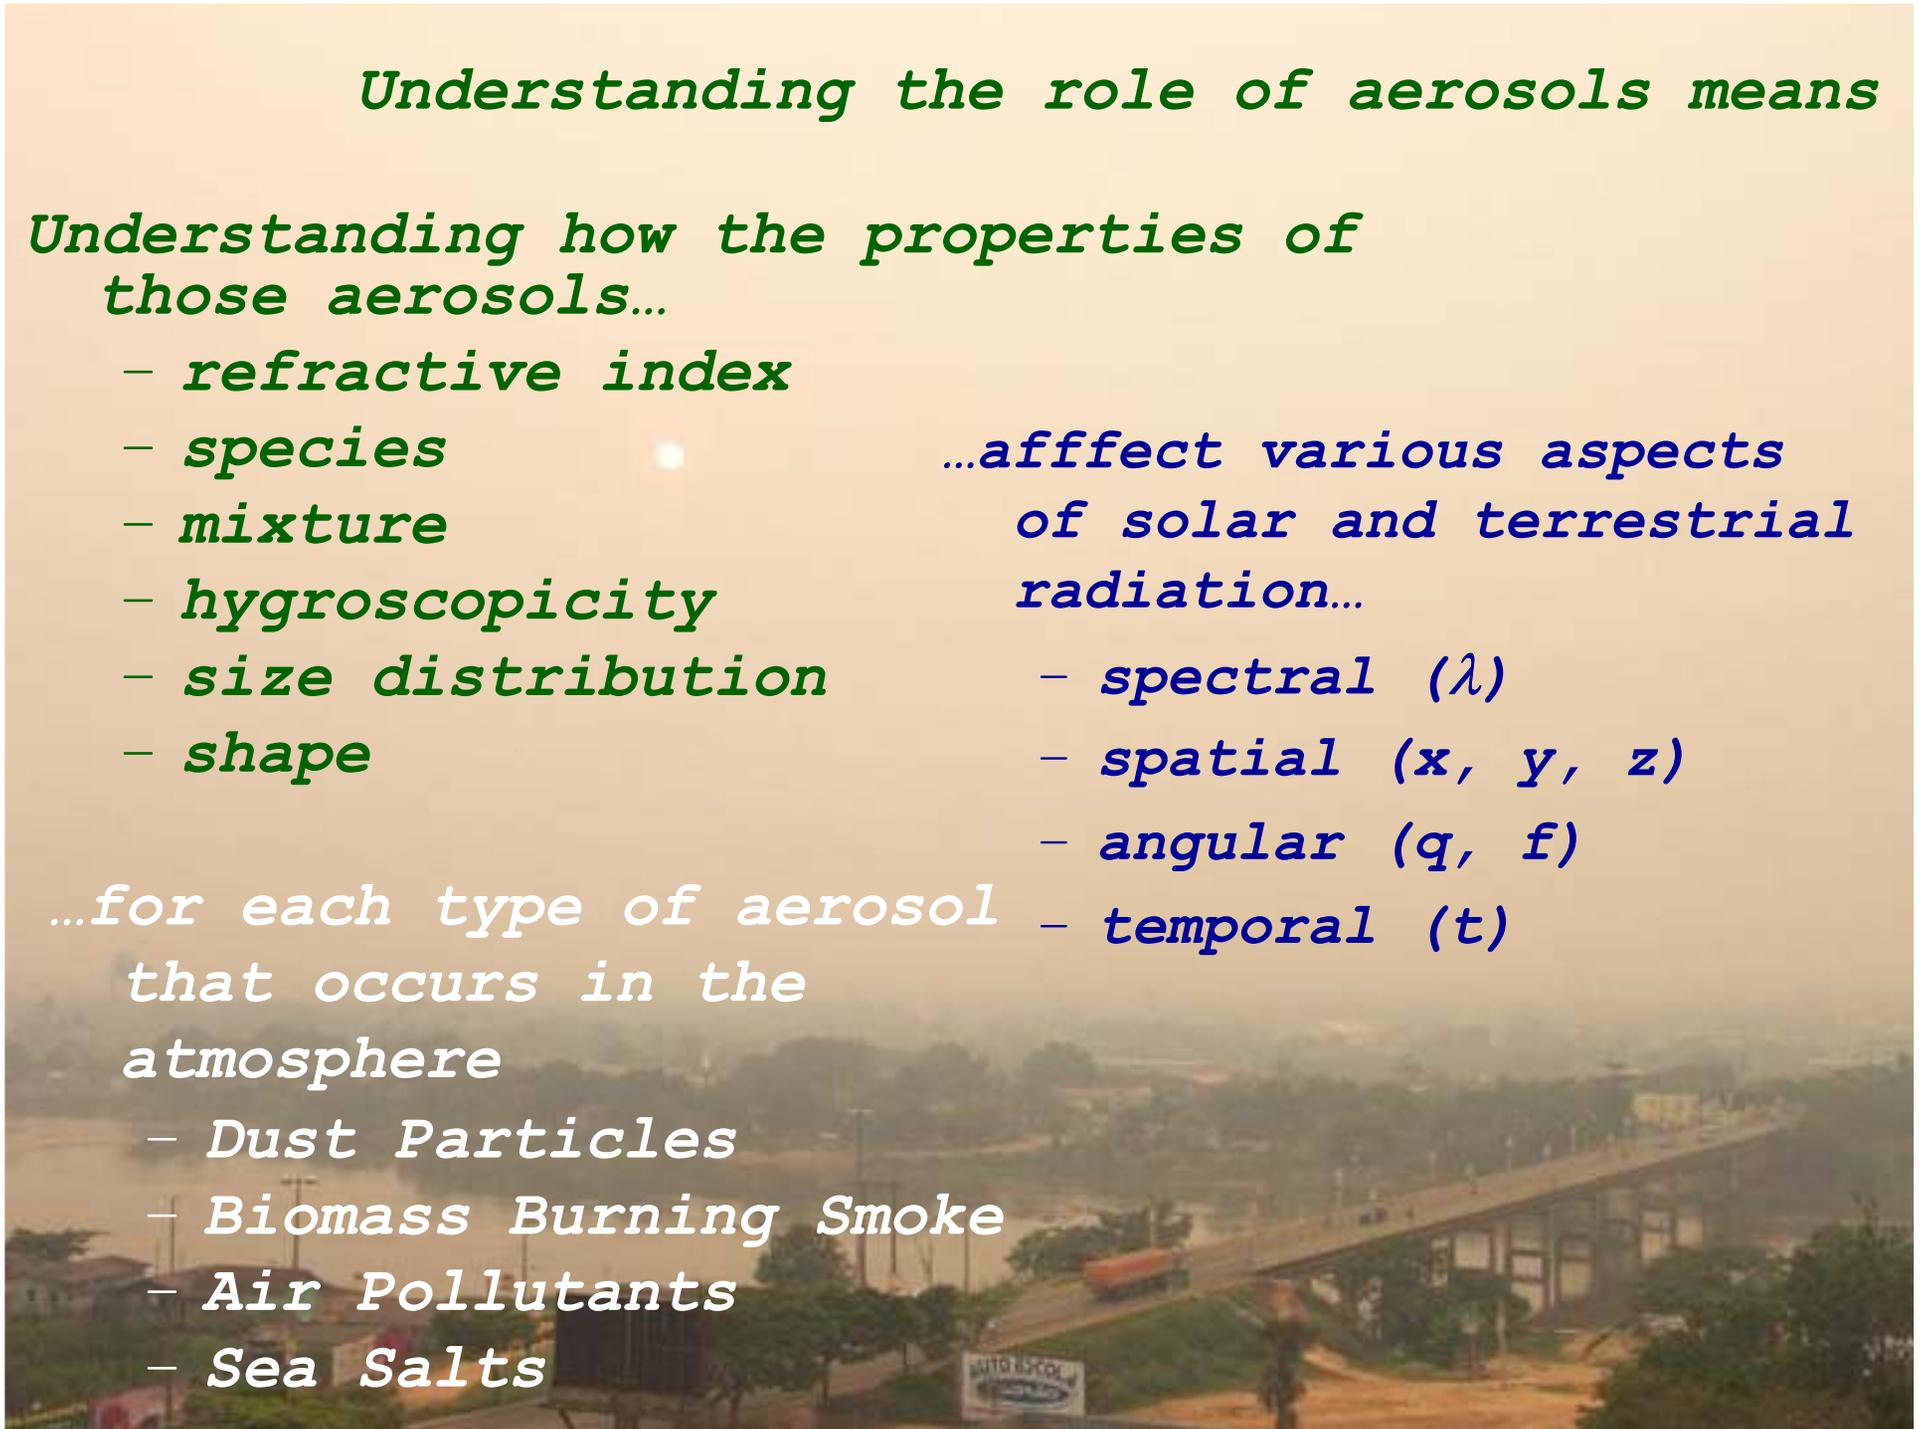

- refractive index*
- species*
- mixture*
- hygroscopicity*
- size distribution*
- shape*

...affect various aspects of solar and terrestrial radiation...

- spectral (λ)*
- spatial (x, y, z)*
- angular (q, f)*
- temporal (t)*

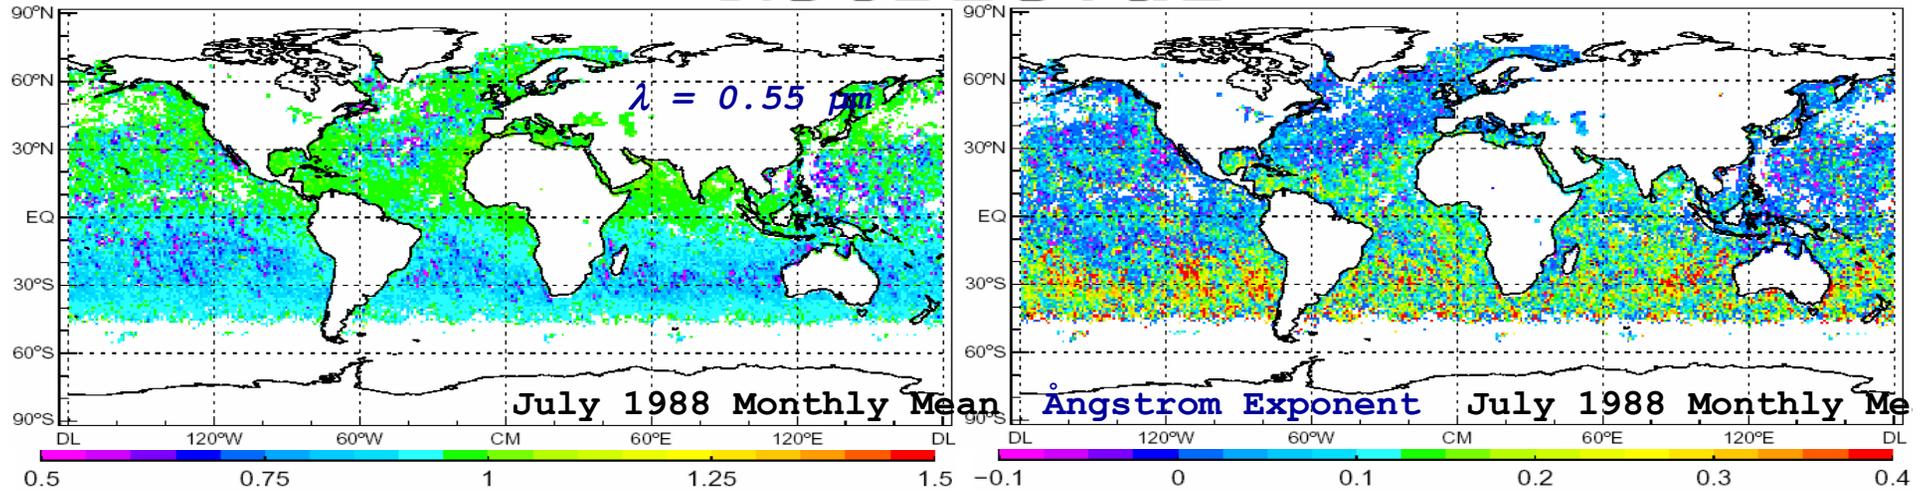

...for each type of aerosol that occurs in the atmosphere

- Dust Particles*
- Biomass Burning Smoke*
- Air Pollutants*
- Sea Salts*

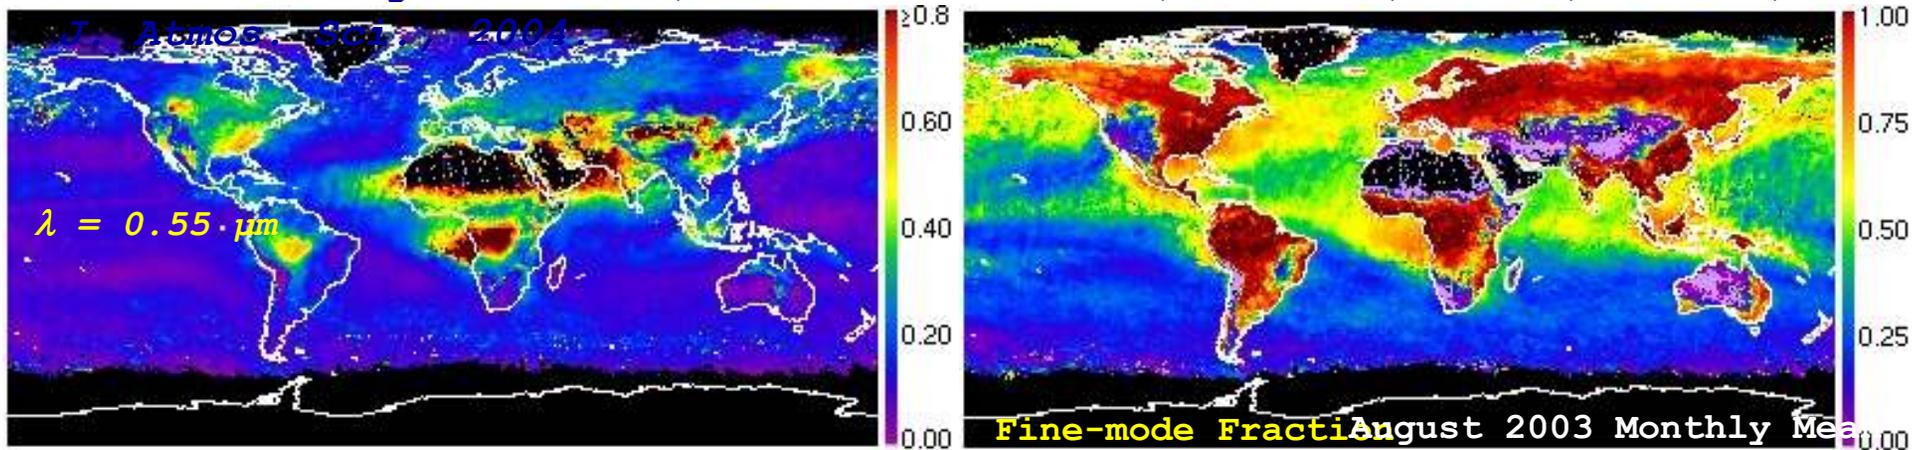

Aerosol Remote Sensing & Retrieval

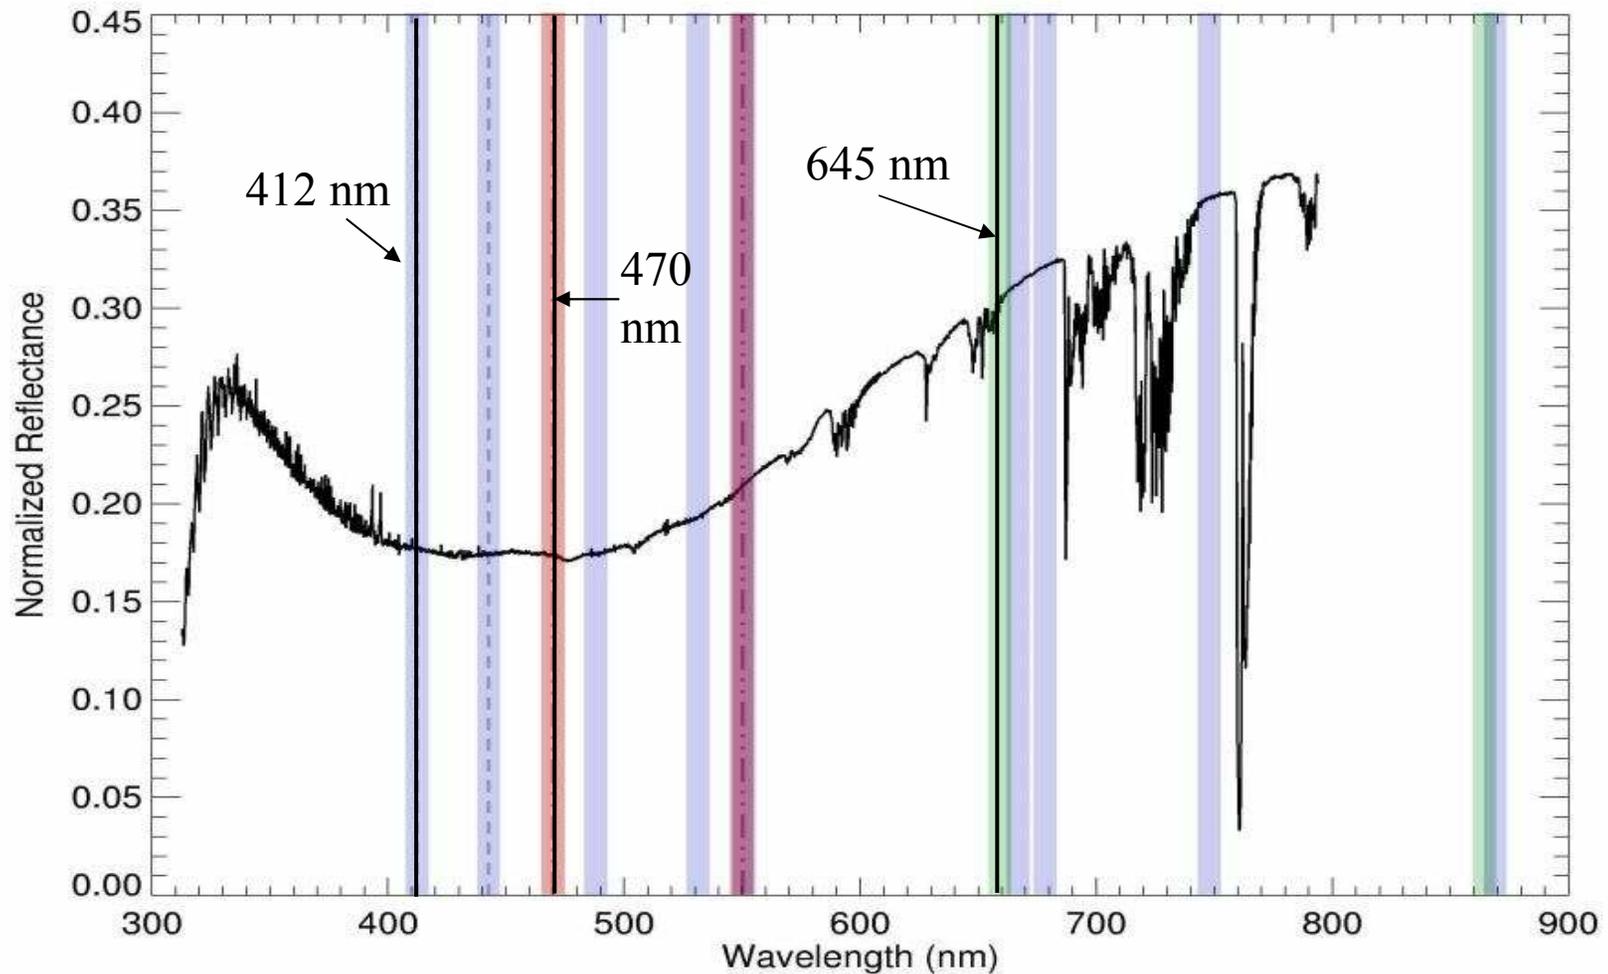

The early days of AVHRR, since 1983: Geogdzhayev, Mishchenko, et al., *J. Atmos. Sci.*,

The current days of MODIS, since 2000: Remer, Kaufman, Tanré, et al.,

Flowchart for Deep Blue Algorithm

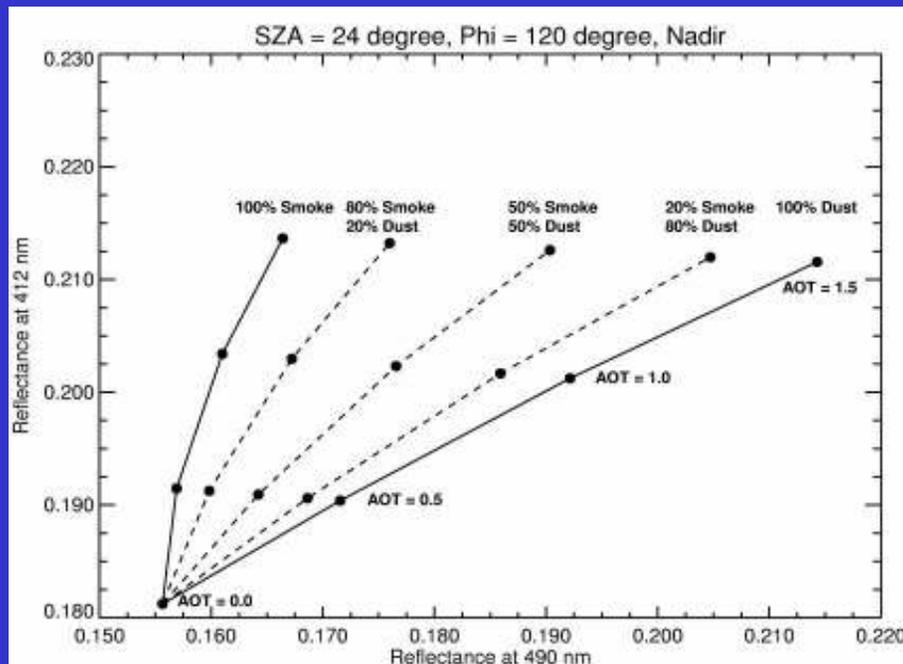

Phase Function for Dust Model

The aerosol characteristics used to generate the simulated radiances in these two figures are shown below

Aerosol Model	$\frac{\tau_{412}}{\tau_{470}}$	$\frac{\tau_{490}}{\tau_{470}}$	Refractive Index 412 nm	Refractive Index 490 nm	ω_0 412 nm	ω_0 490 nm
Dust	1.00	1.00	1.55 – 0.020i	1.55 – 0.008i	0.91	0.96
Smoke	1.30	0.92	1.55 – 0.022i	1.55 – 0.026i	0.90	0.89

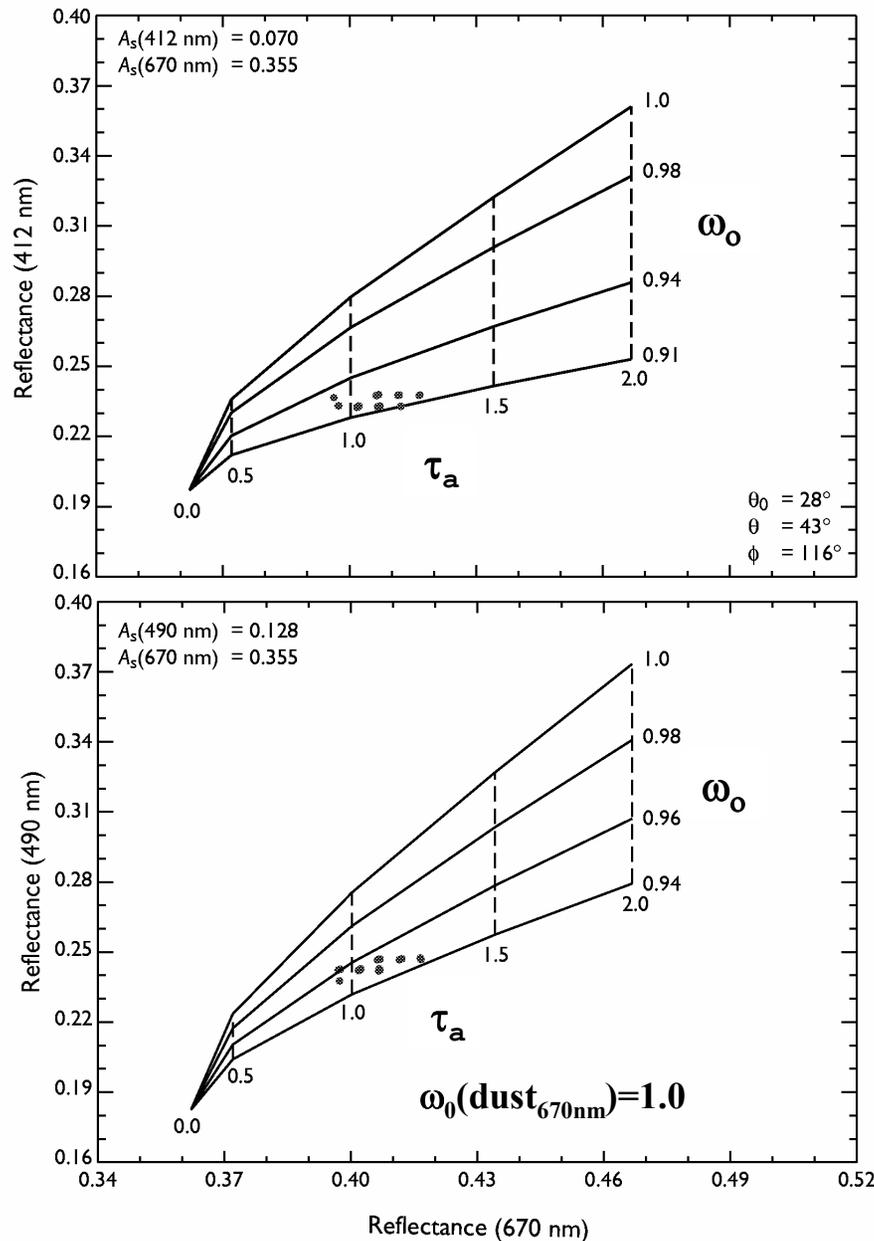

In areas of mixed aerosol types, we linearly mix radiances from the dust aerosol model, R^{dust} , with those from the smoke aerosol model, R^{smoke}

$$R^{\text{smoke}} = aR^{\text{dust}} + (1-a)R^{\text{smoke}}$$

Gaussian distribution with a peak at 3 km and a width of 1 km was assumed

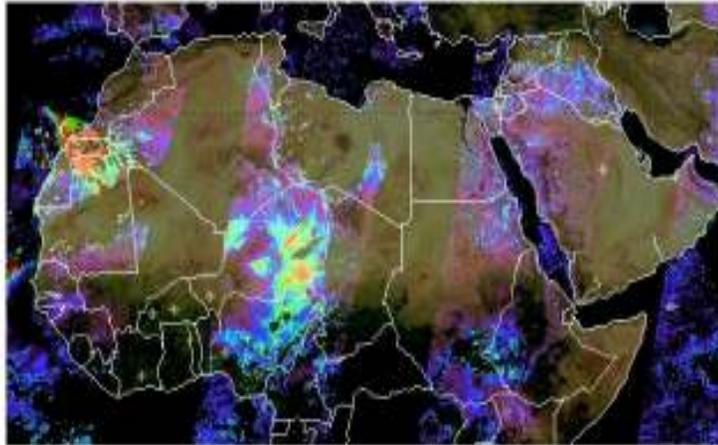

Deep Blue Algorithm for SeaWiFS/MODIS

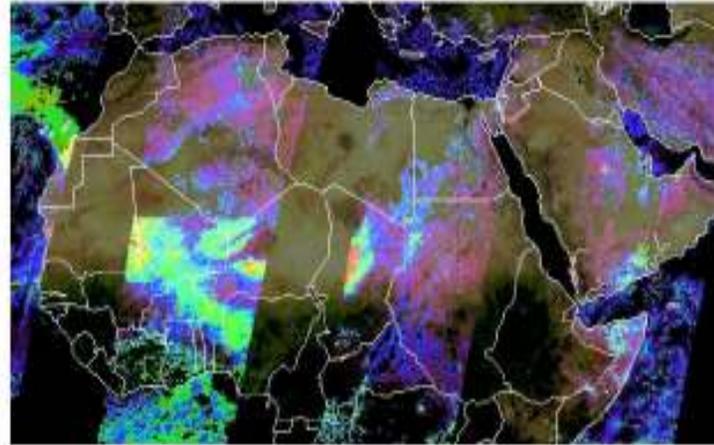

- Utilize solar reflectance at $\lambda = 412, 490,$ and 670 nm to retrieve aerosol optical thickness (τ_a) and single scattering albedo (ω_0).
- Less sensitive to aerosol height, compared to UV methods.
- Works well on retrieving aerosol properties over various types of surfaces, including very bright desert.

Over East Asia*

- *Large Daily Variability in AOT*
- *Frequent Presences of Clouds*

Summary

- *Deep Blue algorithm* provides aerosol *optical thickness, Angstrom exponent* and *single scattering albedo* for both land and water.
- Compared *well* with AERONET aerosol products:
 - Separate dust *well* from other anthropogenic sources
 - Aerosol optical thickness agree with AERONET values within 10-20% over water and 20-30% over deserts
- *Deep Blue algorithm* successfully applied to SeaWiFS and MODIS: *evolution* (spatial & temporal) of aerosols can be studied for the first time over deserts using one consistent algorithm.

Summary (continued)

Current Issues in Aerosol Product Synergy:

- *Presences of Clouds: requires careful selection in geolocation to conduct intercomparisons;*
- *Variability of Aerosol Loading: requires spatial coverage;*
- *Accurate and Consistent Calibration across each individual sensors.*
